 FIRE-LITE® ALARMS
by Honeywell

New Communicator with Dual Path

September 30, 2011
Document FLPA11-09-1

Dear Valued Customer,

Fire-Lite Alarms is pleased to announce the launch of the new Honeywell **IPGSM-DP** fire alarm communicator panel beginning October 3, 2011. The IPGSM-DP, **Dual Path** fire alarm communicator has been enhanced to offer selectable configurable paths: Cellular (GSM) Only, IP (Internet) Only, or IP Primary/Cellular Backup (Default configuration).

The IPGSM-DP Benefits:

- Saves the cost of two dedicated phone lines, and eliminates the problems being seen today with POTS lines.
- Through the Internet or Cellular (GSM) communications, the IPGSM-DP provides reporting from any_contact ID Fire Alarm Control Panels.
- The IPGSM-DP connects directly to the primary and secondary telephone ports and requires no change to the Fire Alarm Control Panel configuration. It answers any phone number dialed!
- The unit has three field-selectable modes of operation:
 1. Mode 1 is dual technology: IP primary, GSM backup with 24 hours supervision.
 2. Mode 2 is single communications path: GSM (cellular) with 5 minutes supervision.
 3. Mode 3 is single communications path: IP (internet) with 5 minutes supervision.
- It supports both dynamic (DHCP), or Static IP addressing – making IP installs a snap.
- The IPGSM-DP sets up easily via Web-Based Programming or hand held programmer.

For buildings without phone lines or internet service, the IPGSM-DP is an excellent application for reporting alarm, supervisory and trouble events to a central station via cellular service. For AHJs that want two communications paths for enhanced survivability, the IPGSM-DP is a great choice for this application using its unique dual technology, reporting through AlarmNet.
